## by Tim Berners Lee

Show embedded data

To view the embedded data encoded in [RDFa](#), hover over the red-dotted areas. You can also [view the data externally](#) in the Graphite Browser, or other tools.

In this 5 star example, we used the [Meteo](#) vocabulary to represent the temperature forecasts. Each forecast has a URI (for example, ['Forecast for Monday, 15 November 2010'](#)), which can be used in another context. Additionally, through linking the place (#Galway) to the DBpedia entry [Galway](#), we have disambiguated it. Eventually we provided context for the interpretation of the #temp through the respective typed links to DBpedia ([Temperature](#) and [Celsius](#)).

# TEMPERATURE FORECAST FOR GALWAY, IRELAND

# AUTHORITY DATA AS LOD

## Rådata nå! — Norwegian personal name authorities as linked data

### About

The Rådata nå! data set is a collection of around 9 million triples representing around 1.5 million personal names. The data was created by a joint project between [BIBSYS](#) and [NTNU University Library](#) with funding from ABM-Utvikling (the Norwegian Archive, Library and Museums authority). The data is structured as [linked data](#).

### Getting the data

The data is available via a [public SPARQL endpoint](#) and as a [bulk download](#).

### Examples

- [Henrik Ibsen](#)
- [Ivar Aasen](#)

### License

We have published this dataset under the Public Domain Dedication and License (PDDL) "Public Domain for data/databases" license. That means that you are free:

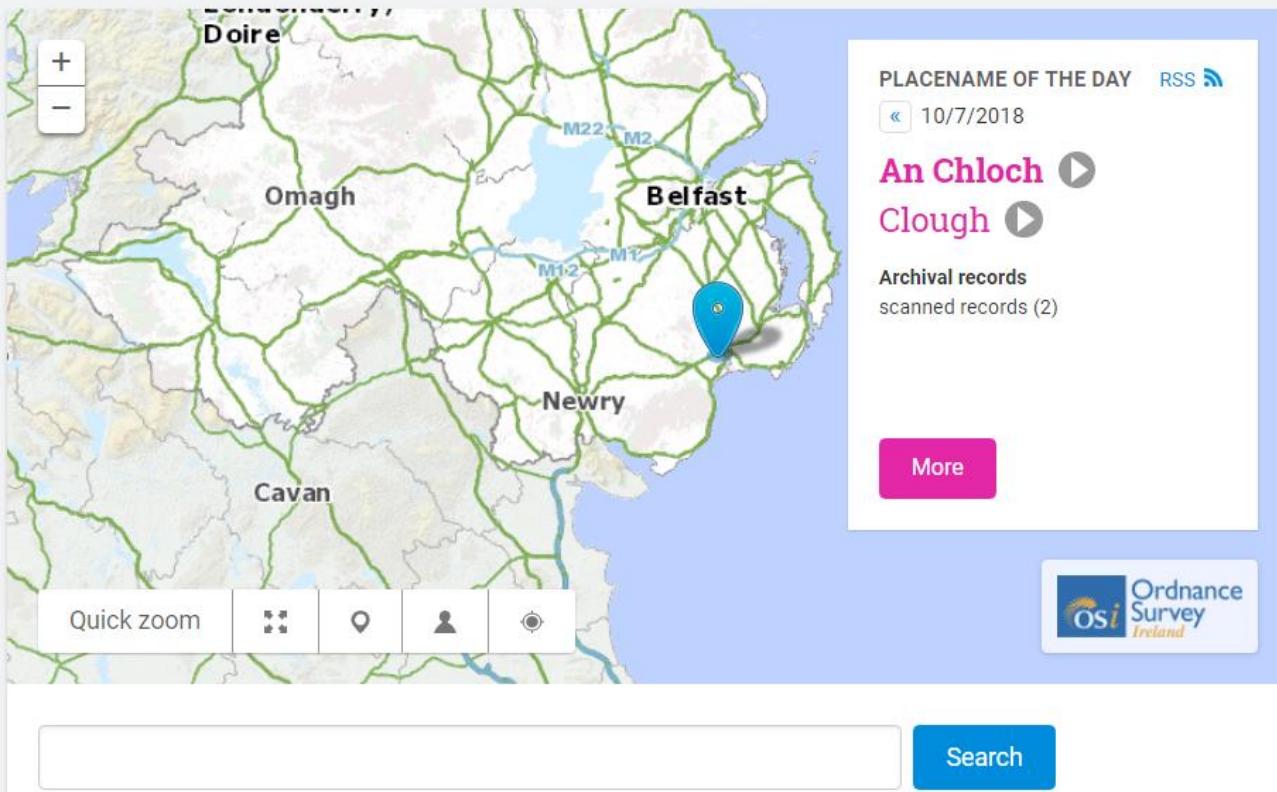

- To Share: To copy, distribute and use the database.
- To Create: To produce works from the database.
- To Adapt: To modify, transform and build upon the database.

There are no requirements or limitations. Read about the license here: <http://www.opendatacommons.org/licenses/pddl/summary/>.

# CLASSIFICATION AS LOD

*a multilingual classification system for cultural content*

## ICONCLASS as Linked Open Data

Every notation in ICONCLASS is associated with a Uniform Resource Identifier (URI) that is unique to that subject heading. For example the concept "Communication of Thought" has a notation of 52D1 and thus the URI becomes: <http://iconclass.org/52D1>. If you click on the aforementioned link, you are redirected to a HTML representation of that concept, fit for human consumption.

It is also possible to retrieve machine-readable formats, by either appending '.rdf' or '.json' to the URI. This will redirect you to either a SKOS/RDF or JSON representation of the concept. For example <http://iconclass.org/52D1.rdf> or <http://iconclass.org/52D1.json>

If you need to retrieve the data for notations containing 'keys' like a 25F23(+46) sleeping lion ensure that you properly encode the + sign in the URL. The link becomes: [http://iconclass.org/25F23\(LION\)\(%2B46\).json](http://iconclass.org/25F23(LION)(%2B46).json) Note how the + sign has been replaced with the characters %2B For more information have a look at the [Wikipedia article for Percent Encoding](#). You have to do the same for names, like: [11H\(BASIL THE GREAT\)](#)

### Retrieving texts for multiple notations in one HTTP call

You can get the text that go with a list of notations in one go, by calling the URL /json/ or /rdf/ with a list of 'notation' parameters for which you would like the data. Here is an example: <http://iconclass.org/json/?notation=25FF&notation=51A>

### Do you want the raw data?

Please don't start scraping away, or fire up the scripts. There are about 1.3 million notations in ICONCLASS (with all keys and children full expanded). You can download a dump of the database in RDF N-Triple form from this link:

<http://iconclass.org/data/iconclass.nt.gz>. (MD5 of the latest file b2913be32dc729ae17d5816e02b22401) The file is 19MB compressed and expands to 340MB. This datafile does not contain all the expanded notations including keys. The size would mushroom, so we are trying to figure out a better way to also make the expanded data available. Please feel free to send me suggestions.

Thanks to Tobias Helms from the GBV for suggesting that we remove the date from the download filename so that automated downloads can just regularly ping the file. I have included an explicit MD5 hash of the file on a link too in case you want to check if there has been changes.

Thanks to Michiel Hildebrand for pointing out that notation literals need quotes too.

## Bathing Water Quality

[Find](#)   [Get the data](#)   [Glossary](#)   [Help](#)

[Web widgets](#) [EA open datasets](#)

## Find a bathing water

Look up a bathing water profile by name or location below. To get an overview of multiple bathing water locations, or to download data extracts, see the [data page](#).

Water quality at designated bathing water sites in England is assessed by the Environment Agency. From May to September, weekly assessments measure current water quality, and at a number of sites daily pollution risk forecasts are issued. Annual ratings classify each site as excellent, good, sufficient or poor based on measurements taken over a period of up to four years. Information about bathing water quality in other countries in the UK can be found here: [Scotland \(SEPA\)](#), [Wales \(NRW\)](#), or [Northern Ireland \(DoE\)](#)

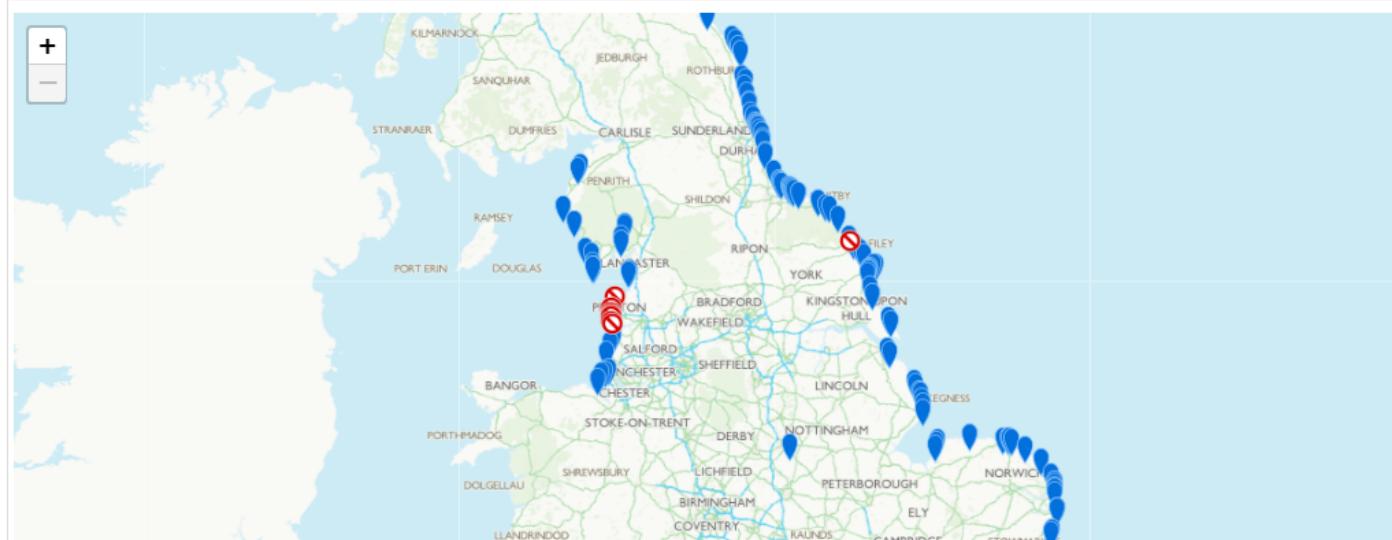

Name, county, district or postcode:

Location, e.g. Cornwall, East Devon or Blackpool

# PROBLEMS

Lack of control

No possibility to revoke opened data

Discrepancies in terminology

Lack of simple tools

Copyright problems

# BENEFITS

Increased visibility of institutions and resources on the Web

„The best way to make information held in cultural institutions visible in the public domain”  
[Europeana]

content enrichment

Use of data in applications, portals, web services (e.g. Google, Bing)

facilitate information retrieval

Use of solutions developed by libraries

linking bibliographic data to other data on the web

maintaining a high authoritative data

Create opportunities for unintentional discovery of new resources
